

PRE-JOB INSPECTION

CHECKLIST

The high-pressure pump must be inspected PRIOR TO EACH USE

Pump is level, wheels chocked

Pump is grounded to earth, battery boxes are shielded, battery charged

All protective guards are in place (plungers, belts, engine cooling fan)

Rupture disc – tagged/rated to the pump and system operating pressure

Filter bag installed/clean

Engine gauge and pressure gauges are in working order

Fire extinguisher accessible, tagged

The maximum working pressure for all equipment, hoses, nozzles, and accessories should be matched to the high-pressure pump capability

All components should be properly labeled, color coded or otherwise marked to indicate compliance

Hoses have been inspected for wear, damage, and proper pressure rating

Hoses are marked with an in-service date – **maximum life is 2 years for flex lances and shotgun whip hoses and 4 years for all other high-pressure hoses**

Shrouds are properly installed to cover any connections or hose that is in close proximity to the operator

Whip checks rated for hose size and pressure are installed and inspected prior to each use

Nozzles are inspected prior to each use, rated for hose size and pressure
